

What Types of CTE Data Are Available?

Through [CTE Data Unlocked](#), colleges and technical assistance providers have access to a range of information on CTE programs provided free-of-charge by the Chancellor's Office.

Early College Credit

Information on students who have met requirements to earn college credit for articulated courses is available through the [CATEMA system](#). This information can be viewed by articulated course, but information is only visible to high schools and college administrators.

Colleges Offering Programs

Regional information on which California community colleges are offering programs, the number of enrollments, and total student headcount are available in the [LaunchBoard Program Snapshot](#) for those with a Cal-PASS Plus account. Data is presented in easy-to-read charts and can be viewed by TOP code or Priority Sector.

[The Centers of Excellence website](#) provides publicly available information on the number of students graduating from all types of educational institutions. Information is displayed through an Excel document that allows for sorting by TOP code, award levels, regions, and counties.

Student Educational Attainment

Annual program- and sector-level information on the demographics of students enrolled in programs, course completion and success rates, retention and persistence rates, certificate and degree attainment, transfers, and skills-builders are available in the LaunchBoard Program Snapshot. This information is displayed in both easy-to-read charts and table formats, with specific reports highlighting equity gaps. Results can be viewed by college, Doing What Matters region, or statewide. Similar information is available to the public in table format on [Data Mart](#) at the college, district, and program level.

Employment and Earnings

Annual program- and sector-level information on employment rates, quarterly earnings, employment in field of study, relationship of earnings to related occupations, and whether students have attained a living wage are available in the LaunchBoard Program Snapshot. This information is displayed in both easy-to-read charts and table formats, and can be viewed by college, Doing What Matters region, or statewide. For employment and earnings figures, disaggregated results are available by student demographics, award type, and skills-builder status. Earnings information on students who received a degree or certificate is available to the public on Data Mart by college and program, but results are aggregated over eight years. Statewide pre- and post-college earnings are posted on [Salary Surfer](#) for completers in specific TOP codes.

Additional information on employment outcomes such as whether students are employed full- or part-time, how long it took for them to find a job, and the impact of coursework on employment is available from the CTE Outcomes Survey. Results can be viewed in table or visual formats in a dedicated [CTEOS LaunchBoard tab](#), with results cut by college, Doing What Matters region, or statewide, with filters for

programs, sectors, and college completion status. On the [Santa Rosa Junior College CTE Outcomes Survey website](#), visitors can access statewide summary reports and, for colleges that have made their data publicly available, information can be analyzed using multiple variables through Tableau software.

Labor Market Information

Regional labor market information is available at the program level on the LaunchBoard Program Snapshot, including total people employed by occupation in the region, projected job openings, and starting and median salaries. This information, which is provided by EMSI, is available in both easy-to-read charts and table formats.

More detailed EMSI information on labor market demand is available on the Centers of Excellence website. Available only to college employees and technical assistance providers, information is displayed through a spreadsheet that can be filtered by region, county, occupational code, and educational level to provide more granular information about regional job markets.

Additionally, for occupations or industry sectors where traditional data is more difficult to find, custom reports analyzing results of employer surveys, both regional and state, are available on the COE website.
